

TPP v.1.1.9.0 updated

04.06.2023

If paid support expired before 24.06.2023, this TOPODRONE Post Processing version will not work for a user. It is necessary to either pay for support or download previous version distributive, the release date of which is earlier than the expiration date of paid support.

Get the distribution: [TOPODRONE Software Distributor](#)

+ **Added:** Satellite filtering utility accelerated by 50 times

+ **Added:** A “ruler” for measuring distances has been added to all maps. You need to click twice on the map and the distance between these points will be written in the logs (in feet or meters depending on the “Feet” checkbox state).

+ **Added:** A new TOPOSLAM algorithm consisting of three stages has been added. At the first stage, the clouds are sequentially overlapped by generation time. The second stage is the mutual overlap of the clouds closest in distance. The third stage, using calibration, returns the position of the matched clouds to the track.

Revision #8
